Topic 3 | JSON Traversal

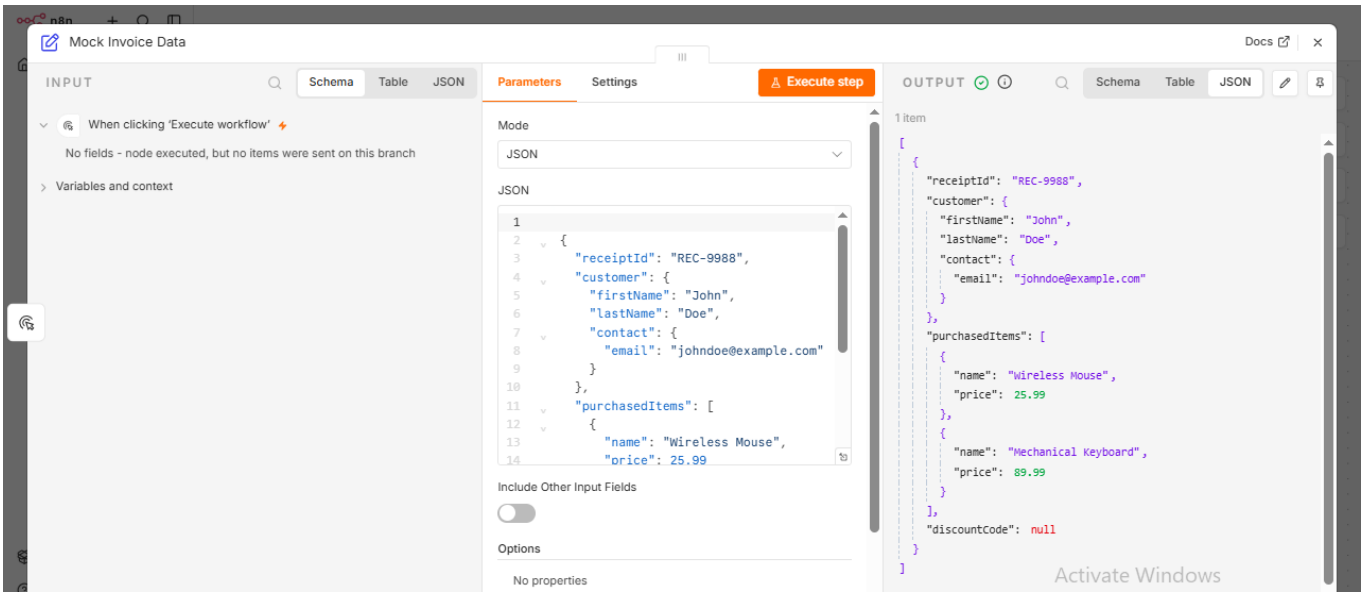

n8n assessment evidence • Workflow: N8N JSON Traversal Workflow • 27 October 2026

Execution overview

Manual Trigger → Mock Invoice Data → Extract Customer Data → HTTP_POST_SendCustomerData

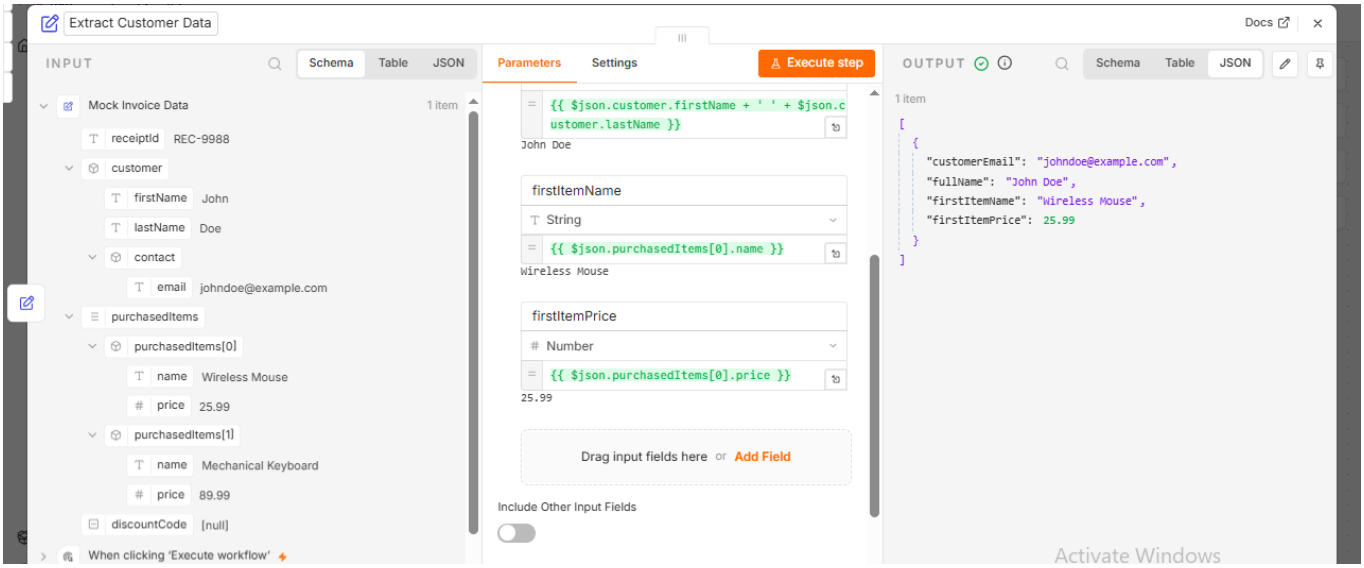

Four screenshots captured during successful node testing and the final workflow execution are presented below. JSONPlaceholder is a simulated API; the screenshots do not demonstrate permanent data storage.

01 | Mock invoice JSON input

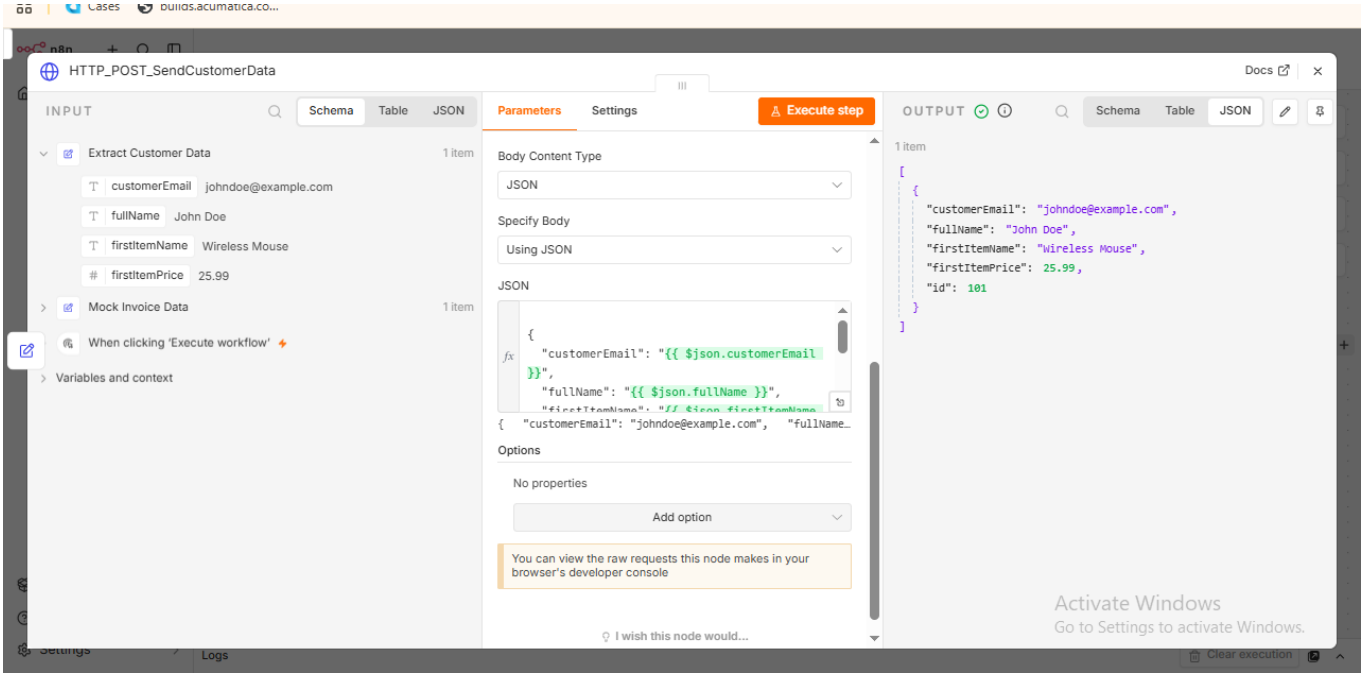

The Edit Fields node creates one mock invoice with nested customer details, two purchased items, and a null discount code.

02 | Customer data extraction

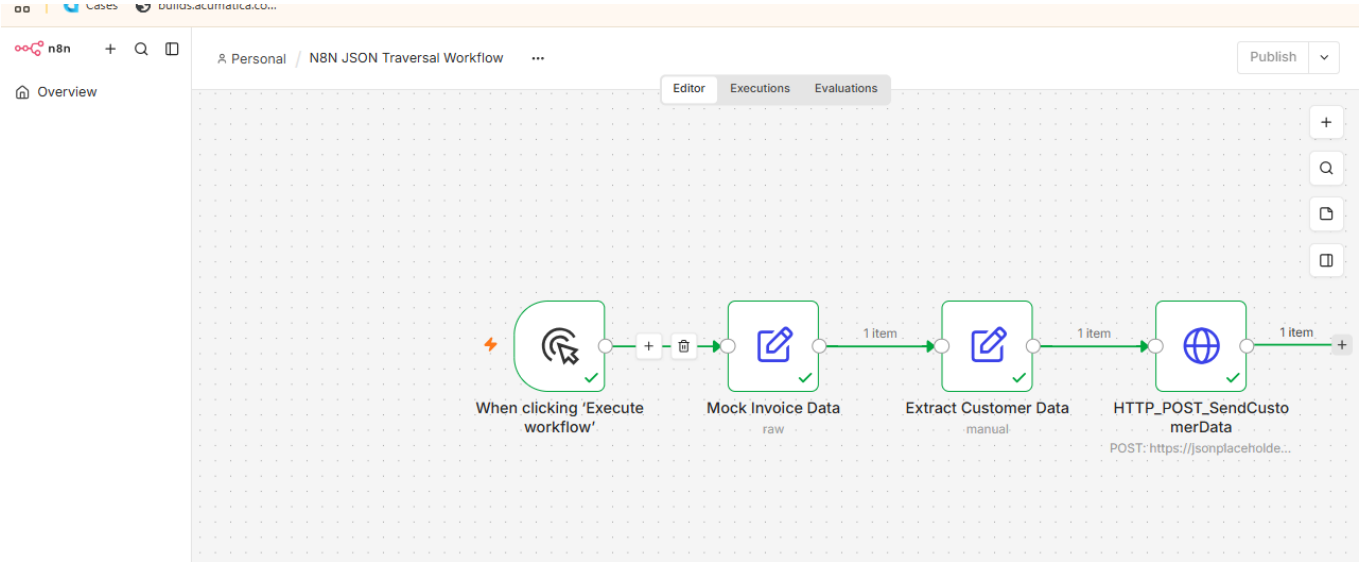

The extraction node returns the customer email, full name, first purchased item, and numeric price using JSON paths and array indexing.

03 | Successful HTTP POST response

The HTTP Request node sends the extracted data to JSONPlaceholder and receives the expected fields with a simulated response ID of 101.

04 | Final end-to-end execution

All four connected nodes display successful execution checkmarks, demonstrating the complete JSON traversal and POST sequence.
